

Attendees

- akesi ma (Stellar Station / Wizden)
- april (The Den / Macrocosm)
- bird (Starlight)
- Catty (Funky Station)
- Centronias (Moffstation)
- checkraze (Frontier)
- Chief_Engineer (Adminbus)
- cyberjoel (Delta-V / Frontier / Afterlight / Euphoria)
- Falcon (Aurora's Song)
- Fan (Impstation / Macrocosm / Aurora's Song)
- Fried (Moffstation)
- gruesomegray (Harmony)
- hivehum (Impstation / Macrocosm)
- huck (The Den)
- Jajsha (Harmony)
- Jimboe (Delta-V)
- June (The Den / Macrocosm)
- lobsterpaw (Impstation)
- mqole (Impstation / Macrocosm)
- Myzumi (Tools)
- Nairod (Cosmatic Drift)
- Princess (Wizden)
- r3d (Starlight)
- Rainbeon (Funky Station / Macrocosm)
- Ress (Wizden)
- Rinary (Starlight)
- Rosie (Aurora's Song)
- ScarKy0 (Wizden)
- Tech Coarse (Euphoria)
- Velken (Moffstation)
- willow (Funky Station)
- youtissoum (Harmony)

Slides:  SCC 7 june

Date: Jun 6, 2026

Minutes taken by mqole (493234058088677379)

Meeting chaired by hivehum (160111662966374400)

Topics

Welcome Aurora's Song!

Going over agenda and meeting rules.

A lot of hurt feelings from people today. Keeping it civil, keep it relevant. No venting or attacks on character.

What happened today?

Aquif's article linked in chat - <https://notaslug.org/posts/wizden-implosion/>

mqole provides brief summary of events referring back to aquif's post

- auth servers go down, wizden announcement saying outage was caused by pjb. initially thought that she deleted infrastructure, later found out that it was just taken offline. lot of general chat panicking.
- pjb made an announcement in devbus to say that backdoor was used to hack into database, she took servers down as first response, information compromised
- wizden publically issued cease and desist in wizden announcements due to being blocked. c&d letter leaked was early version which didnt have accurate information that was in final.
- several hours later princess put out announcement saying wizden was working on new infrastructure
- pjb put auth back up, this was communicated in devbus
- before auth went back up, RMC went down / was compromised. details unclear, to be discussed in meeting. several downstreams went offline after this as a precaution including impstation (mqole server)
- several other downstreams created independent auth services- taydeo's funky auth, used by imp, den, rmc. RMC still offline so not able to officially migrate, just in progress
- **scarky0**: not sure when c&d letter was received, was filed before auth went down. *(note: previous version of these minutes incorrectly stated c&d was filed after auth went down. this is inaccurate - the c&d was initially filed before auth went down, after auth went down a public announcement was issued to ensure it was received. -mqole via princess)*
- reddit posts & forum posts that occurred documented by aquif

lot of minimal evidence accusations from both parties ("backdoor"), important to establish the evidence we have for allegations

- **princess:** we did not use a backdoor, we accessed servers legally. pjb posted logs of people accessing servers via ssh. no unusual traffic, very normal logins, standard behaviour. no evidence received from pjb by wizards den. not impossible that a 3rd party acted here. possible that we will never have evidence as pjb wiped database after putting it back up as a security measure
- **mqole:** what happened to rmc.
 - **princess:** not sure. up to smug to say. rmc taking forensic image of database. had a cybersecurity expert in call, helped confirm pjb didnt delete db. expert said that what happened to rmc was malicious (possb someone at host fucking up and deleting whole server, or malicious attack- not necessarily backdoor, maybe exploit on hardware level). still unsure who is responsible or what happened, just that its serious
- **fan:** initial announcement "deleted key infrastructure".
 - **princess:** this was an assumption, announcement made quickly to avoid speculation. ended up being inaccurate. replies dont get pushed to devbus so there is a chance this updated announcement didn't get pushed. will do an announcement later today to update. forums still down, believe nothing was deleted

Wizden plan moving forward

princess: waiting on legal go ahead / infra. focusing on staff restructuring & getting stable staff ongoing - continuing initial plans. was planning to finalize today- week delay. trying to set servers & infra back up in addition to existing plan

- does wizden intend to set up a seperate auth instance to the one operated by pjb?
 - **princess:** at this time yes. person who is better equipped to answer is not in attendance.
- is there anything downstream will need to actively do to use this?
 - **princess:** if upstream doesn't control DNS, yes. lawyers will figure out. infrastructure that was co owned by mult. wizards are up in the air, could go to either party. contingencies in place. answer- it depends!
- **fan:** was there an inciting incident that led to the statement to pjb saying "we will go on without you"? downstreams felt blindsided.
 - **princess:** leak of internal 'beg' post, more in there that hasn't been leaked, long argument as a result. genuine grievances, communication breakdown, failure to comply, lack of trust in PJB. this led to c&d getting sent as negotiations broke down effectively completely.

- **nalrod per aquif:** Do you expect the legal matters to take an extended duration and do you think it will cause significant hampering in wizard's den's abilities?
 - **princess:** legal matters, will take time. going to set up temporary measures. not sure about anything other than it will take a while, reliant on PJB compliance. won't take years based on estimates given. not very difficult to prove what is needed. international legal, pjb country of origin, location of llc, means that a lot of things need to be taken into account. big complication. cyber crimes (not cyberjoel) are generally agreed upon internationally so hopefully not too big an issue. in terms of affecting abilities, will get things running, but very likely that if pjb continues to support auth / infra there will be 2 wizards dens (confusing).

Is it safe for servers to remain online

princess: yes. no reason to believe auth has backdoors or anything. obviously be careful, unsure how rmc got taken down (accident unlikely, malicious), rmc got ddos'ed earlier, could be a followup.

- **hive:** was assured that what got rmc taken down was rmc specific issue.
 - **princess:** assume yes
- **cyberjoel:** is userbase info in multiple places?
 - **princess:** yes. pjb copied data, & wizden has copy. shouldn't be security risk. will be transferred to holding company, any action taken can be criminally pursued
- **fan:** word "leaker" keeps being used. apparently someone within wizden team leaking things. is this a worry?
 - **princess:** we do not use discord for posting sensitive info, at worst staff messages. only worry is things like c&d (phone numbers, emails). no confidential info typically in discord. just huge annoyance taking out of context / harrassment / etc.
- **chief_engineer:** was c&d leaked from discord or pjb?
 - **princess:** assuming discord / discourse, was posted on forums, heavily reduced who leaker could have been. probably not pjb as it is not newest version - formal retraction & update was done. as far as aware c&d was not seen by pjb until update sent as she took no action. definitely someone on the discord, leaked probably before pjb saw it. identifying leaker is a seperate concern
- **checkraze:** the +HOST level perms in particular are dangerous because they allow for arbitrary C# code execution on the server box

- **princess:** removing these permissions are a good precaution to take, remove from all admins including host themselves
- **cyberjoel:** We recommended to everyone in euphoria to change passwords since the passwords are in multiple places and the good rule of thumb is keep the 1:1:1 ratio, 1 password 1 source, 1 destination.

is it safe to use ss14 auth atm?

princess: it would be out of character for pjb to act maliciously, so probably ok.

reading out chief engineer's message of what is possible if malicious actor has access to things:

All of the below is information about what a malicious actor could do with control of the following components. Whether or not a malicious actor has control over these is a separate question.

Hub

Malicious hub can give fake listings, allowing any server to be impersonated. This is, at base, relatively low risk because the launcher won't just let you use an arbitrary engine version so the risk is essentially just connecting to a server pretending to be another. Hopefully no server is setup in a way that people type in passwords once connected, that's definitely not an upstream behavior, so this is largely a non-issue.

Steam Listing

Can upload malicious launcher version. There are ways to check when a steam listing last had its packages changed.

Launcher

This is sort of the top of the chain on the player end. You can theoretically control everything on the player end if you control this. You can execute arbitrary code on player's computers.

Engine

I'm not sure how engine version verification is split from the launcher. A malicious launcher can cause a malicious engine version to be served, but the launcher itself can also do anything a malicious engine version can do so this is just a dropper behavior. Existing engine versions can be patched to be malicious. I just don't know what exactly needs to be controlled to do this. It's possible that launcher control is needed to successfully do this, but idk if it is or not.

Auth

A user authenticating to malicious auth is generally only risking the information they provide. Malicious auth can be modified to store passwords in plaintext or some shit. Email addresses are generally stored in plaintext anyway, so malicious vs compromised is not a difference with regard to email addresses. When a server uses an authentication provider, anyone who controls that provider can authenticate as any user, which can be leveraged for other purposes. Anyone who controls SS14 auth can login to any server that uses SS14 auth as any user, including users with host permissions, and do anything

those users can, including execute arbitrary code on the server (assuming a user with host permissions exists)

chief_engineer: tldr: launcher, steam dangerous to user. auth dangerous to server hosts.

- **fan:** do not know pjb, but seems like the average player will not be fucked over. nothing significantly user-facing.
- **jimboe:** scc has been incredibly productive- was late to meeting but having a plan is very reassuring, thanks to everyone for being here. much love & solidarity, situation much more manageable w a safety net
- **nairod:** its pronounced neigh-rod like a horse
- **r3d:** is anyone responsible for actively monitoring the code bundle that the cdn drops while it's under PJB's control? it would be good to have someone at least responsible to be the canary-in-the-coal-mine
 - **princess:** not currently. most maints dropped from org, everyone who could have watched repos dropped. people will have to do due diligence, will have to set up things.
 - **ress:** can do hash comparison on existing CDN download links, but do not have anything set up in place for monitoring.
 - **hive:** good to have system in place even if unlikely it will happen.
 - **chief_engineer:** can try and check but never be 100% sure.

what alternatives exist to current auth

- **catty:** funkyauth is one, but it is temporary while the main auth is under pjb control. from what tay said, this is mainly out of concern that pjb could just shut down the auth at any time like she did yesterday.
- **ress:** Right now I don't care about the game servers, I care more about the engines that WizDen as a ORG provided as a service
- **nairod:** There's the Null-link thing I've heard, but I'm not qualified to speak on that.
 - **hive:** believe it to be operated out of discord.
- **april:** funkys is decoupled of discord.
 - **rainbeon:** Funky is staying on FunkyAuth until WizDen gives a proper update on Auth past the "we're working on it" from last night, and it being okay to use, mostly

- **mqole:** 2 big solutions, funky and null link. possibility for more. rmc's discord link nor relevant as it is down / being migrated to funky. funky primary advantage is that it is decoupled from discord. personal experience using this system for discord. edit server toml to point to auth server. users asked to register with funkystation forums, link ss14 account automatically (currently down) or create temporary game account and admins can independently vet users and assign GUID of player's existing ss14 account. users must make sure launcher / client points to auth service, need to use command line. tay wrote instructions for flatpak and linux. imp process is manual ("i printed out all our player GUIDs in a pdf") hivehum mqole and april given access on funky forums to do this
 - **hivehum:** it was 2 pdfs. interface has sufficient idiot-proofing
- **checkraze:** we have essentially emergency expanded our existing admin tools to register our players in the same system just in case, and myzumi has a few working solutions to spin up our own continuance auth but so far it would require some small engine changes to modify the handshake so we are still waiting for a more optimum solution. myzumi is going to probably keep poking about to make a 3rd party auth work yet for us but frontier will likely go to funky's auth if things turn sour fast again
- **taydeo via catty:** players who have mismatched data need to use funky support unless we speak and reach an agreement with another community about putting their own mods and admins on the forum

aquifs proposal

Wizden is currently in a very unstable state right now and is likely going to be bogged down in court for years. Additionally, project morale is likely not doing particularly good. Therefore, I don't think they are a good home for shared community infrastructure at the moment. I would propose that we as a group start hosting our own infrastructure following one of the proposals discussed initially and have all interested member servers switch over to that.

princess: probably not years. would prefer there to be centralized infrastructure limited to very small group of trusted people, sensitive data needing to be handled securely. data held by LLC. community will need to consent to new infrastructure- downstreams have a lot of power. upstream would prefer to be able to handle it for security's sake. in terms of official options, preferred that we do not have a 2nd wizden. something we need to talk to lawyers about. need to set up bridge to make it easier. setting up EV / LLC condition for pjb to transfer all keys. this is actually needed to avoid causing downstream upstream drama. now PJB is no longer involved in wizden timetable can be moved up. 20th as tentative date for setting this up. hivehum as tentative community manager for this system. using bridge to leverage strength of community to get us up and running. pjb has access to servers but this will probably not remain true as staff are not there, trust has been broken. long term wizden is going to be ok, setting up bridge quicker will help this.

- **jimboe:** keeping legal stuff vague. possible suggestion of wizden speaking about a preliminary injunction.
 - **princess:** it has been done.
- **jimboe:** is wizden looking to host own auth and recreate everything or recoup everything.
 - **princess:** end goal is to recoup, in the meantime we are setting up temporary alts

Further discussion

catty: mention that funky auth doesnt work on mac atm.

- **april:** im on the case

princess: change 2 week meeting thing to 1 week meeting.

- **hivehum:** everyone pitching things not the most productive use of time. next meeting next week, not 2 weeks- faster pace. will ask aquif

mq: will release minutes in 24 hours after proofreading etc

jajsha: what is a bridge?

- **princess:** channel upstream where upstream & downstream chat can congregate and chat, server hosts/ reps, talking directly to owners of project. primarily for opening communications about prs, what is desired, upstreaming etc, jumping off point to bring downstreams into upstream staff. building communication as has not been the best in the past. not intended to take place of admin/devbus, place for direct collaboration rather than a development resource, bridge would be focused on upstream, place for downstream to raise concerns with upstream prs. ability for server heads to talk with directors of project. directors will be delegating majority of tasks, act as a direct line for downstream to discuss state of changes to project as opposed to downstream vagueing upstream.

april: den was affected by EE dehub, are policies around hub administration changing.

- **princess:** prefer not to talk about hub at the moment, still up in the air. non-negotiable that getting dehubbed would lose access to bridge, but bridge will be an effective way to communicate with downstreams and determine whether or not to take action re dehubbing. a lot of EE dehubs were justified but some strays were caught and a couple got rehugged- bridge would allow more control in situations like this. moderation director as a role with direction over hub stuff. focus on direct communication

fan: aquifs webpage is not wizden; is wizden going to put out an official announcement to sum everything up / curb rumor mill / leaks / questions?

- **princess:** yes after the meeting, devbus post has misinfo in it. need to make sure legally its all good.
- **everyone:** PLEASE SLEEP

things are moving. there are fires on our ass but we are moving

princess: a couple maintainers still have access to the repo but more than half the people in org were removed, remainder largely inactive. development effectively halted atm. honestly decent timing as a content freeze was planned for new staff onboarding, hand just forced. this at least makes it easier to explain why we are having a content freeze

c_e: does wizden know why people who weren't removed from access were not removed?

- **scar:** from what i saw (not official statement) it looks like its letter people again.
- **princess:** no clue, people who did send the letter on there still. unsure. no idea. something pjb actively did. would need to double check.

heart goes out to wizden staff, much love
